

- For each given relation  $R_i \subseteq M_i^2$ , determine whether it is *reflexive*, *irreflexive*, *coreflexive*, *symmetric*, *antisymmetric*, *asymmetric*, *transitive*, *antitransitive*, *semiconnex*, *connex*, *left/right Euclidean*. Provide a counterexample for each non-complying property (e.g., “transitivity does not hold for  $x, y, z = (3, 1, 2)$ ”). Organize your answer in a table (e.g., columns – relations, rows – properties).
  - $M_1 = \mathbb{R}$   
 $x R_1 y \leftrightarrow |x - y| \leq 1$
  - $M_2 = \mathcal{P}(\{a, b, c\})$   
 $R_2 = “\subseteq”$
  - $M_3 = \{a, b, c, d\}$      $\|R_3\| = \begin{bmatrix} 0 & 1 & 0 & 1 \\ 0 & 0 & 0 & 1 \\ 1 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix}$
  - $M_4 = \{\text{“rock”, “scissors”, “paper”}\}$   
 $R_4 = \{\langle x, y \rangle \mid x \text{ beats } y\}$
- Prove (rigorously) or disprove (by providing a counterexample) the following statements about arbitrary homogeneous relations  $R \subseteq M^2$  and  $S \subseteq M^2$ :
  - If  $R$  and  $S$  are *reflexive*, then  $R \cap S$  is so.
  - If  $R$  and  $S$  are *symmetric*, then  $R \cap S$  is so.
  - If  $R$  and  $S$  are *transitive*, then  $R \cap S$  is so.
  - If  $R$  and  $S$  are *reflexive*, then  $R \cup S$  is so.
  - If  $R$  and  $S$  are *symmetric*, then  $R \cup S$  is so.
  - If  $R$  and  $S$  are *transitive*, then  $R \cup S$  is so.
- An equinumerosity relation  $\sim$  over sets is defined as follows:  $A \sim B \leftrightarrow |A| = |B|$ .
  - Show that  $\sim$  is an equivalence relation over finite sets.
  - Show that  $\sim$  is an equivalence relation over infinite sets<sup>1</sup>.
  - Find the quotient set of  $\mathcal{P}(\{a, b, c, d\})$  by  $\sim$ .
- Let  $R_\theta$  be a relation of  $\theta$ -similarity (clearly,  $\theta \in [0; 1] \subseteq \mathbb{R}$ ) of finite non-empty sets defined as follows: a set  $A$  is said to be  $\theta$ -similar to  $B$  iff the Jaccard index  $\text{Jac}(A, B) = \frac{|A \cap B|}{|A \cup B|}$  for these sets is at least  $\theta$ , i.e.  $\langle A, B \rangle \in R_\theta \leftrightarrow \text{Jac}(A, B) \geq \theta$ .
  - Draw the graph of a relation  $R_\theta \subseteq \{A_i\}^2$ , where  $\theta = 0.25$ ,  $A_1 = \{1, 2, 5, 6\}$ ,  $A_2 = \{2, 3, 4, 5, 7, 9\}$ ,  $A_3 = \{1, 4, 5, 6\}$ ,  $A_4 = \{3, 7, 9\}$ ,  $A_5 = \{1, 5, 6, 8, 9\}$ .
  - Determine whether  $\theta$ -similarity is a tolerance relation.
  - Determine whether  $\theta$ -similarity is an equivalence relation.
- The characteristic function  $f_S$  of a set  $S$  is defined as follows:
 
$$f_S(x) = \begin{cases} 1 & \text{if } x \in S \\ 0 & \text{if } x \notin S \end{cases}$$

Let  $A$  and  $B$  be finite sets. Show that for all  $x \in \mathcal{U}$ :

  - $f_{\bar{A}}(x) = 1 - f_A(x)$
  - $f_{A \cap B}(x) = f_A(x) \cdot f_B(x)$
  - $f_{A \cup B}(x) = f_A(x) + f_B(x) - f_A(x) \cdot f_B(x)$
  - $f_{A \oplus B}(x) = f_A(x) + f_B(x) - 2f_A(x) \cdot f_B(x)$
- Find the error in the “proof” of the following “theorem”.
 

“Theorem”: Let  $R$  be a relation on a set  $A$  that is symmetric and transitive. Then  $R$  is reflexive.

“Proof”: Let  $a \in A$ . Take an element  $b \in A$  such that  $\langle a, b \rangle \in R$ . Because  $R$  is symmetric, we also have  $\langle b, a \rangle \in R$ . Now using the transitive property, we can conclude that  $\langle a, a \rangle \in R$  because  $\langle a, b \rangle \in R$  and  $\langle b, a \rangle \in R$ .
- Give an example of a relation  $R$  on the set  $\{a, b, c\}$  such that the symmetric closure of the reflexive closure of the transitive closure of  $R$  is not transitive.

<sup>1</sup> For infinite sets,  $|A| = |B|$  means there is a bijection between  $A$  and  $B$ .

8. Prove or disprove the following statements about the functions  $f$  and  $g$ :
- (a) If  $f$  and  $g$  are injections, then  $g \circ f$  is also an injection.
  - (b) If  $f$  and  $g$  are surjections, then  $g \circ f$  is also a surjection.
  - (c) If  $f$  and  $f \circ g$  are injections, then  $g$  is also an injection.
  - (d) If  $f$  and  $f \circ g$  are surjections, then  $g$  is also a surjection.
9. Let  $H = \{1, 2, 4, 5, 10, 12, 20\}$ . Consider a divisibility relation  $R \subseteq H^2$  defined as follows:  $xRy \leftrightarrow y : x$ .
- (a) Sort  $R$  (as a set of pairs) lexicographically<sup>2</sup>.
  - (b) Show that  $R$  is a partial order.
  - (c) Determine whether  $R$  is a linear (total) order.
  - (d) Draw the Hasse diagram for a graded poset  $\langle H, R, \rho \rangle$ , where  $\rho : H \rightarrow \mathbb{N}_0$  is a grading function which maps a number  $n \in H$  to the sum of all exponents appearing in its prime factorization, e.g.,  $\rho(20) = \rho(2^2 \cdot 5^1) = 2 + 1 = 3$ , so the number 20 would have the 3rd rank (bottom-up).
  - (e) Find the minimal, minimum (least), maximal and maximum (greatest) elements in the poset  $\langle H, R \rangle$ . If there are multiple or none, explain why.
  - (f) Perform a topological sort<sup>4</sup> of the poset  $\langle H, R \rangle$ .
10. Prove that the transitive closure  $R^+$  is in fact transitive.
- Definition.**  $R^+ = \bigcup_{n \in \mathbb{N}^+} R^n$  is a transitive closure of  $R \subseteq M^2$ , where
- \*  $R^{k+1} = R^k \circ R$  is a compositional (functional) power<sup>3</sup>,
  - \*  $R^1 = R$ ,
  - \*  $S \circ R = \{\langle x, y \rangle \mid \exists z : (x R z) \wedge (z S y)\}$  is a composition (relative product) of relations  $R$  and  $S$ .
11. Prove that a set  $S$  is infinite if and only if there is a proper subset  $A \subset S$  such that there is a one-to-one correspondence (bijection) between  $A$  and  $S$ .
12. Given a set  $S$  and two partitions  $P_1$  and  $P_2$  of  $S$ , we define the relation  $P_1 \leq P_2$  as follows: partition  $P_1$  is considered a *refinement* of the partition  $P_2$  if every set in  $P_1$  is a subset of one of the sets in  $P_2$ . Show that the set of all partitions of a set  $S$  with the refinement relation  $\leq$  is a lattice.

<sup>2</sup> Lexicographic order for pairs:  $\langle a, b \rangle \leq \langle a', b' \rangle \leftrightarrow (a < a') \vee ((a = a') \wedge (b \leq b'))$

<sup>3</sup> Note: this is *not* a Cartesian power, despite of the same notation  $R^n$ . Another possible notation for compositional power is  $R^{\circ n}$ , but it is too wild to use it here.
