

1. Perform the following steps:

- (a) Calculate the SHA-256 hash  $h$  of the string  $s = \text{"Your Full Name HW3"}$  (substitute your full name as in the scores table, without quotes, with all spaces, encoded in UTF-8). Convert hash  $h$  to a 256-bit binary string  $b$  (prepend leading zeros if necessary). Cut the binary string  $b$  into eight 32-bit slices  $r_1, \dots, r_8$ , e.g.,  $r_2 = b_{33..64}$ . Xor all slices into a 32-bit string  $d = r_1 \oplus \dots \oplus r_8$ .
- (b) Draw the Karnaugh map (use a template below) for a function  $f(A, B, C, D, E)$  defined by the truth table  $d$  (MSB corresponds to 0, LSB to 1). Use it to find the number of prime implicants<sup>1</sup>.

2. For each given function  $f_i$  of 4 arguments, draw the Karnaugh map and use it to find BCF, minimal DNF, and minimal CNF. Additionally, construct ANF (Zhegalkin polynomial) using either the tabular ("triangle") method or the Pascal method – use each method at least once.

**Note:** WolframAlpha<sup>2</sup> interprets the query " $n$ -th Boolean function of  $k$  variables" in a reverse manner. In order to employ WolframAlpha properly, manually flip the truth table beforehand, e.g., the correct query for  $f_{10}^{(2)}$  is "5th Boolean function of 2 variables"<sup>2</sup>, which gives  $f_{10}^{(2)} = \neg x_2$ , since  $\text{rev}(1010_2) = 0101_2 = 5_{10}$ .

- (a)  $f_1 = f_{47541}^{(4)}$  (c)  $f_3 = f_{51011}^{(4)} \oplus f_{40389}^{(4)}$   
 (b)  $f_2 = \sum m(1, 4, 5, 6, 8, 12, 13)$  (d)  $f_4 = \overline{A}BD + \overline{A}\overline{C}D + \overline{B}C\overline{D} + A\overline{C}D$

3. Convert the following formulae to CNF.

- (a)  $X \leftrightarrow (A \wedge B)$  (d)  $\text{majority}(X_1, X_2, X_3)$ <sup>2</sup>  
 (b)  $Z \leftrightarrow \bigvee_i C_i$  (e)  $R \rightarrow (S \rightarrow (T \rightarrow \bigwedge_i F_i))$   
 (c)  $D_1 \oplus \dots \oplus D_n$  (f)  $M \rightarrow (H \leftrightarrow \bigvee_i D_i)$

4. Compute the truth table for the function  $f: \mathbb{B}^3 \rightarrow \mathbb{B}^2$  (with the semantics  $\langle A, B, C \rangle \mapsto \langle f_{(1)}, f_{(2)} \rangle$ ) represented with the following circuit.

<sup>1</sup> Here, consider only implicants represented as product terms.

<sup>2</sup> Majority function<sup>2</sup> is a Boolean function that is 1 iff the majority (more than half) of the inputs are 1.

5. Show — without using Post's criterion — that the Zhegalkin basis  $\{\oplus, \wedge, 1\}$  is functionally complete.
6. For each given system of functions  $F_i$ , determine whether it is functionally complete. For each basis  $F_i$ , use it to rewrite the function  $g(A, B, C) = A \rightarrow ((\neg A \oplus B) \wedge \neg C)$ . Draw a schema (Boolean circuit) for each resulting formula.
- (a)  $F_1 = \{\wedge, \vee, \neg\}$  (c)  $F_3 = \{\rightarrow, \nrightarrow\}$   
(b)  $F_2 = \{f_{14}^{(2)}\}$  (d)  $F_4 = \{1, \leftrightarrow, \wedge\}$
7. Construct a minimal (in terms of the number of gates) Boolean circuit that implements the conversion of 4-bit binary numbers to Gray code<sup>2</sup>, i.e. the function  $f: \mathbb{B}^4 \rightarrow \mathbb{B}^4$  with the semantics  $(b_3, b_2, b_1, b_0) \mapsto (g_3, g_2, g_1, g_0)$ , e.g.,  $0000_2 \mapsto 0000_{\text{Gray}}$ , and  $1001_2 \mapsto 1101_{\text{Gray}}$ . Use only NAND and NOR logic gates.
8. Consider a Boolean function  $f: \mathbb{B}^3 \rightarrow \mathbb{B}$  defined as follows:  $f(x, y, z) = \begin{cases} x & \text{if } z=0 \\ y & \text{if } z=1 \end{cases}$ . Construct a formula for it using the standard Boolean basis  $\{\wedge, \vee, \neg\}$ .
9. Binary Decision Diagram<sup>2</sup> is a representation of a Boolean function as a directed acyclic graph, which consists of *decision* nodes and two *terminal* nodes (0 and 1). Each decision node is labeled by a Boolean variable  $x_i$  and has two child nodes called *low* and *high*. The edge from node to a low (high) child represents an assignment of the value FALSE (TRUE, respectively) to variable  $x_i$ . A path from the root node to the 1-terminal (0-terminal) represents an assignment for which the represented Boolean function is true (false, respectively). BDD is called *ordered* if different variables appear in the same order on all paths from the root. For example, if the natural order  $x_1 < x_2 < \dots < x_n$  is used, the root is marked with the variable  $x_1$ , its children with  $x_2$ , etc. Note that some variables in the order can be skipped, if necessary. For each given function  $f_i$ , construct an Ordered Binary Decision Diagram using the natural order. Determine whether the OBDD can be reduced by using a different variable order — if so, draw it.
- (a)  $f_1 = x_1 \oplus x_2 \oplus x_3 \oplus x_4$  (c)  $f_3 = \sum m(1, 2, 5, 12, 15)$   
(b)  $f_2 = \text{majority}(x_1, \dots, x_5)$  (d)  $f_4 = x_1x_4 + x_2x_5 + x_3x_6$
